

From Exit to Opportunity:
Understanding Member Behaviour
Post-employment and Conversion to
Managed program.

Agenda

- Objective/Dataset overview
- Key Data Domains and Data issues
- Data Preparation – Cleaning steps and Assumptions
- Business Insights and Identify Trends
- Recommendations

Objective

To evaluate member behaviour following exit from group retirement plans, assess data quality, and identify actionable insights that can improve engagement and increase enrollment in the Managed program.

Key Data Domains

Data Domains	Fields
Member demographics	Age, province, uniqueID
Employment	Sponsor name, termination date, term balance, campaign
Financials and lifecycle events	Withdrawal amount, withdrawal date, rollover amount, rollover date, member status
Sales methods	FSC assisted, self-serve, auto
Channel of Communications	Number of call attempt, contacted client, email attempts, email opened, email clicked

Assumptions

- If a rollover amount/date is present, CSC transition was completed. If a withdrawal amount/date is present, GRS account was withdrawn.
- Each record represents one primary outcome (rollover/withdrawal/pending).
- Records sharing the same uniqueID but showing different demographic and employment attributes represent different members, not multiple events for the same member.
- Age reflects the member's age at the termination date and is suitable for segmentation purposes.
- Rollover must be initiated via FSC assisted/Auto/self-serve.

Data Quality and Integrity

Data Quality:

- Dates were not standardized (YYYY-MM-DD).
- Monetary fields are not consistently formatted to two decimal places.
- Missing values in fields – Age, province, campaign

Data Integrity:

- Rollover/withdrawal date occurs before the termination date which violates expected business logic.
- Invalid age entries (Null, 1,2) were removed due to negligible analytical impact.

Ambiguous Field Definition:

- Withdrawal amount and withdrawal date lack clear definitions, as it is unclear whether withdrawals are from GRS or Managed accounts.
- Channel aligned – 'No proactive Epic "Changing Employer" or FSC.

Data Governance:

- For 'Campaign' field, multiple free-text formats by different employers/sponsors.
- Duplicated uniqueID – core demographic attributes were different.

Improvement Opportunities

Date and Currency

- Standardized date and currency formatting across all source systems
- Validation rules to prevent rollover/withdrawal dates preceding termination date.

Blank entries

- Mandatory field requirements for critical attributes (Age, province, campaign, uniqueID, sponsor company)

Invalid age entries

- Replace static age fields with DOB for dynamic age calculations.
 - Strengthen unique identifier governance to prevent potential ID reuse.
-

Field Classifications

- **Primary key** – uniqueid
- **Continuous numeric variables** – age, term balance, rollover amount, withdrawal amount
- **Discrete temporal variable** – termination date, withdrawal date, rollover date
- **Categorical variables** – spousal account, employer/sponsor name, FSC assisted, self-serve, Auto, campaign, channel aligned, province, FSC call attempts, FSC email freq, inbound freq, DBA email open and click, FSC_Contacted, Contacted client

Understand Member Behaviour

Questions after leaving the employer

- What do members do after termination or retirement?
- Who enrolls to Managed program vs. who doesn't?
- What factors influence decisions?

Younger and older members are more likely to withdraw funds, while middle-aged members are relatively more likely to rollover.

Transition to Choices Program

Members transitioned to Choice program from January 2021 to December 2022

Mid-career members demonstrated stronger engagement and transition activity into the Managed program, while older members contributed the highest rollover amounts overall.

Total Rollover Amount by Age Group

Total Withdrawals Over Time

Account withdrawals are concentrated among members aged 55–65, indicating higher decumulation activity approaching or entering retirement age.

Another Perspective: FSC Interaction

Rollover Rate for members between 55 and up when they are contacted by FSC

Rollover probability decreases as the delay in first FSC contact increases, suggesting early engagement is a key driver of successful retention outcomes

Sales Channel

FSC Assisted appears to generate the strongest customer traction among the sales methods. It suggests that complex financial decisions require personalized guidance.

Drive Business Action

How can Sun Life:

Increase enrollment?

Implement early intervention and targeted educational campaigns for retirement-age groups to increase awareness of available Managed program options, including health benefits, insurance, and investment management services.

Improve engagement?

Financial Service Consultant outreach within 5-7 days of termination date to understand member's financial and family situation. Focus on holistic consultation approach.

Key Variables That Influence Behaviors

Age - transition accounts, rollover funds, withdraw savings, seek financial guidance

Account balance – depends on the portfolio performance and compound growth

Termination date - post-employment engagement opportunities, economic impact,

Financial literacy – education on the Managed program, financial well-being,

Lifestyle and stage in life – reason: retirement/termination, support from family, demographic trends, financial behaviours/needs

Employer benefits – pension plan, severance package, health care benefits

Optimize Data Processing and Reduce Errors

Increase accuracy and consistency of the database

- Add 'Account status' column for clear indication if account rollover/withdrawn
- Add dropdown options for sales method, province, campaign and sponsor company
- Create a master reference table for sponsor companies

Thank
you
